1.1 OverView

(a) Write a computer program for computing the histogram of an image.
(b) Implement the histogram equalization technique.
(c) Your program must be general to allow any gray-level image as its input.
As a minimum, your report should include the original image, a plot of its histogram, a plot of the transformation function, the enhanced image, and a plot of its histogram.

1.2 Generate the Histogram

1.2.1 Function

Generating the histogram of an image using following function:

$$H(i) = the\ number\ of\ pixel\ whose\ value\ euquals\ to\ i \tag{1.1}$$

1.2.2 Histogram

The histogram pictures of Fig1.jpg and Fig2.jpg are listed as follows:

Figure 1.1: Histogram of fig1.jpg

Figure 1.2: Histogram of fig2.jpg

1.3 Transfer Function

1.3.1 Implement the Histogram Equalization Technique

We use those functions to calculate the histogram equalization:

$$L = Max(image(r,c))\ \forall r \in [1, rows]\ and\ \forall c \in [1, cols] \tag{1.2}$$

$$s(r_k) = L * T(r_k) = L * \sum_{j=0}^{k} P_r(r_j) = L * \sum_{j=0}^{k} \frac{n_j}{n} \tag{1.3}$$

1.3.2 Transfer Function

The transfer function of Fig1.jpg and Fig2.jpg are listed as follows:

Figure 1.3: Transfer Function of fig1.jpg

Figure 1.4: Transfer Function of fig2.jpg

1.4 Enhanced Images

1.4.1 Enhanced Function

We use the function

$$New\ Image(r,c) = Transfer\ Function(image(r,c))\ \forall r \in [1, rows]\ and\ \forall c \in [1, cols] \quad (1.4)$$

to enhance the original images.

1.4.2 Enhanced Images

The original images and enhanced images and histogram comparation are listed as follows.

Figure 1.5: original image and enhanced image and histogram comparation of fig1.jpg

Figure 1.6: original image and enhanced image and histogram comparation of fig2.jpg

2.1 OverView

Implement the image enhancement task of Section 3.7 (Fig 3.43, page 171). The image to be enhanced is skeleton_orig.tif. You should implement all steps in Figure 3.43. (You are encouraged to implement all functions by yourself, not to directly use Matlab functions such as imfilter or fspecial.)

2.2 Image b

2.2.1 Laplacian Transform Filter

We apply Laplacian Transform on the original image to get the image (b) using the following filter.

$$\begin{bmatrix} -1 & -1 & -1 \\ -1 & 8 & -1 \\ -1 & -1 & -1 \end{bmatrix}$$

2.2.2 Laplacian Transform

Image b:

Figure 2.1: Laplacian Transform of skeleton_orig.tif

2.3 Image c

The we add the Laplacian of the original image to the original image, we will get the new image c. The new image c is a rather noisy sharpened image.
Image c:

Figure 2.2: Laplacian Transform of skeleton_orig.tif

2.4 Image d

2.4.1 Sobel Gradient Masks

We will use two mask to separately get the components g_x and g_y. Then add the two components together, we will get the the sober gradient of the original image. The new image is as follows. As we can see, edges are much more dominant in this image than in the Laplacian image.

g_x:

$$\begin{bmatrix} -1 & -2 & -1 \\ 0 & 0 & 0 \\ 1 & 2 & 1 \end{bmatrix}$$

g_y:

$$\begin{bmatrix} -1 & 0 & 1 \\ -2 & 0 & 2 \\ -1 & 0 & 1 \end{bmatrix}$$

2.4.2 Image d

Image d:

Figure 2.3: Laplacian Transform of skeleton_orig.tif

2.5 Image e

Image e is formed by smoothing image d by 5*5 mean filter.
Image e:

Figure 2.4: Laplacian Transform of skeleton_orig.tif

2.6 Image f

Image f is formed by the product of Laplacian and smoothed-gradient image. The dominance of the strong edges and the relative lack of visible noise, which is the key objective behind masking the Laplacian with a smoothed gradient image.
Image f:

Figure 2.5: Laplacian Transform of skeleton_orig.tif

2.7 Image g

Adding the image f to the original image and then we get image g.
image g:

Figure 2.6: Laplacian Transform of skeleton_orig.tif

2.8 Image h

2.8.1 Power-Law Transformation

We use the following function to perform Power-Law Transformation on image g.

$$s = cr^{\gamma} \ (c \ = \ 1 \ and \ \gamma \ = \ 1) \tag{2.1}$$

2.8.2 Image h

Image h:

Figure 2.7: Laplacian Transform of skeleton_orig.tif

3.1 OverView

Implement the ideal, Butterworth and Gaussian lowpass and highpass filters and compare the results under different parameters using the image characters_test_pattern.tif (this image file can be found at the ftp server ftp://ftp.cs.sjtu.edu.cn:990/lu-ht/DIP/images) as the test pattern.

3.2 Fourier Transform

3.2.1 Transform Function

We ⊠rst need transform the image to gray image and then use the 2D Fourier transformation belw to change it to the frequence domain.

$$F(u,v) = \sum_{x=0}^{M-1}\sum_{y=0}^{N-1} f(x,y)e^{-j2\pi(\frac{ux}{M}+\frac{vy}{N})} \tag{3.1}$$

$$f(x,y) = \frac{1}{MN}\sum_{u=0}^{M-1}\sum_{v=0}^{N-1} F(u,v)e^{j2\pi(\frac{ux}{M}+\frac{vy}{N})} \tag{3.2}$$

3.2.2 Fast Fourier Transform

The inverse funtion of FFT is as folows:

$$F(u+\frac{M}{2}, v+\frac{N}{2}) = \sum_{x=0}^{M-1}\sum_{y=0}^{N-1} f(x,y)e^{-j2\pi(\frac{ux+x\frac{M}{2}}{M}+\frac{vy+v\frac{N}{2}}{N})} \tag{3.3}$$

$$= \sum_{x=0}^{M-1}\sum_{y=0}^{N-1} f(x,y)e^{-j2\pi(\frac{ux}{M}+\frac{vy}{N})} * e^{-j\pi x} * e^{-j\pi y} \tag{3.4}$$

$$= \sum_{x=0}^{M-1}\sum_{y=0}^{N-1} -1^{x+y} f(x,y)e^{-j2\pi(\frac{ux}{M}+\frac{vy}{N})} \tag{3.5}$$

3.3 Filtering

- Expand image$(M*N)$ to image a$((2*M)*(2*N))$
- Perform the fourier transform on the new image and get image b
- Shift image b and get image c
- Perform the convolution on image c and filter and get image d
- Shift image d back and get image e
- Perform the inverse fourier transform on image e and get image f
- Cut image f to get the final result image$(M*N)$;

3.4 Ideal Filter

3.4.1 Ideal Low Pass

Ideal Low Pass Filter

The ideal low pass filter is defined as follows:

$$H(u,v) = \begin{cases} 1, & D(u,v) \leq 0 \\ 0, & D(u,v) > 0 \end{cases} \tag{3.6}$$

$$D(u,v) = \sqrt{[(u - \frac{P}{2})^2 + (v - \frac{Q}{2})^2]} \tag{3.7}$$

Result

Figure 3.1: ILPF of characters_test_pattern.tif

3.4.2 Ideal High Pass

Ideal High Pass Filter

The ideal high pass filter is defined as follows:

$$H(u,v) = \begin{cases} 0, & D(u,v) \leq 0 \\ 1, & D(u,v) > 0 \end{cases} \tag{3.8}$$

$D(u,v)$ is defined in (3.7)

Result

Figure 3.2: ILPF of characters_test_pattern.tif

3.5 Butterworth Filter

3.5.1 Butterworth Low Pass

Butterworth Low Pass Filter

The butterworth low pass filter is defined as follows:

$$H(u,v) = \frac{1}{1+[D(u,v)/D_0]^{2n}} \tag{3.9}$$

$D(u,v)$ is defined in (3.7)

Result

Figure 3.3: BLPF of characters_test_pattern.tif

3.5.2 Butterworth High Pass

Butterworth High Pass Filter

The butterworth high pass filter is defined as follows:

$$H(u,v) = \frac{1}{1+[D_0/D(u,v)]^{2n}} \tag{3.10}$$

$D(u, v)$ is defined in (3.7)

Result

Figure 3.4: BLPF of characters_test_pattern.tif

3.6 Gaussian Filter

3.6.1 Gaussian Low Pass

Gaussian Low Pass Filter

The gaussian low pass filter is defined as follows:

$$H(u,v) = e^{-\frac{D^2(u,v)}{2\sigma^2}} \tag{3.11}$$

$D(u,v)$ is defined in (3.7)

Result

Figure 3.5: GLPF of characters_test_pattern.tif

3.6.2 Gaussian High Pass

Gaussian High Pass Filter

The gaussian high pass filter is defined as follows:

$$H(u,v) = 1 - e^{-\frac{D^2(u,v)}{2\sigma^2}} \tag{3.12}$$

$D(u,v)$ is defined in (3.7)

Result

Figure 3.6: GLPF of characters_test_pattern.tif

4.1 OverView

In this problem, you are required to write a program to generate different types of random noise (Uniform, Gaussian, Rayleigh, Gamma, Exponential and Impulse, first started from the uniform noise and then use some functions to convert the uniform noise to Gaussian, Rayleigh, Gamma and Exponential; Impulse noise is generated in a different way, consulting the textbook and some other references) and then add these noises to the test patter image Fig0503(original_pattern).tif to compare the visual results of the noisy images.
Add some of these noises to the circuit image Circuit.tif (images can be found at ftp://ftp.cs.sjtu.edu.cn:990/lu-ht/DIP/images) and investigate the noise reduction results using different mean filters and order statistics filters as the textbook did at pages 344-352 (Pages 322-329 in the electronic version of the textbook).

4.2 Noise

4.2.1 Uniform Noise

The PDF of $uniformnoise$ is given by

$$p(z) = \begin{cases} \frac{1}{b-a}, & if\ a \leq z \leq b \\ 0, & otherwise \end{cases} \tag{4.1}$$

The mean of this density function is given by

$$\overline{z} = \frac{a+b}{2} \tag{4.2}$$

and its variance by

$$\sigma^2 = \frac{(b-a)^2}{12} \tag{4.3}$$

Figure 4.1: Uniform Noise

4.2.2 Gaussian Noise

The PDF of a $Gaussian$ random variable, z, is given by

$$p(z) = \frac{1}{\sqrt{2\pi}\sigma} e^{-\frac{(z-\bar{z})^2}{z\sigma^2}} \tag{4.4}$$

and it can generate form uniform noise by

$$X = \sqrt{-2lnU} cos(2\pi V) \tag{4.5}$$
$$Y = \sqrt{-2lnU} sin(2\pi V) \tag{4.6}$$

U and V come form uniform(0,1).

Figure 4.2: Gaussian Noise

4.2.3 Rayleigh Noise

The PDF of $Rayleighnoise$ is given by

$$p(z) = \begin{cases} \frac{2}{b}(z-a)e^{-\frac{(z-a)^2}{b}}, & for\ z \geq a \\ 0, & for\ z < a \end{cases} \tag{4.7}$$

The mean and variance of this density are given by

$$\overline{z} = a + \sqrt{\frac{b\pi}{4}} \tag{4.8}$$

and

$$\sigma^2 = \frac{b(4-\pi)}{4} \tag{4.9}$$

and it can generate form uniform noise by

$$z = a + \sqrt{-bln[1-U(0,1)]} \tag{4.10}$$

Figure 4.3: Rayleigh Noise

4.2.4 Erlang(Gamma) Noise

The PDF of $Erlangnoise$ is given by

$$p(z) = \begin{cases} \frac{a^b z^{b-1}}{(b-1)!} e^{-az}, & for\ z \geq 0 \\ 0, & for\ z < 0 \end{cases} \tag{4.11}$$

The mean and variance of this density are given by

$$\overline{z} = \frac{b}{a} \tag{4.12}$$

and

$$\sigma^2 = \frac{b}{a^2} \tag{4.13}$$

and it can generate form uniform noise by

$$E_i = -\frac{1}{a} ln[1 - U(0,1)] \tag{4.14}$$

$$z = E_1 + E_2 + \cdots + E_b \tag{4.15}$$

Figure 4.4: Gamma Noise

4.2.5 Exponential Noise

The PDF of $exponentialnoise$ is given by

$$p(z) = \begin{cases} ae^{-az}, & for\ z \geq 0 \\ 0, & for\ z < 0 \end{cases} \tag{4.16}$$

The mean and variance of this density function are

$$\overline{z} = \frac{1}{a} \tag{4.17}$$

and

$$\sigma^2 = \frac{1}{a^2} \tag{4.18}$$

and it can generate form uniform noise by

$$z = -\frac{1}{a} ln[1 - U(0,1)] \tag{4.19}$$

Figure 4.5: Exponential Noise

4.2.6 Impulse Noise

The PDF of $(bipolar)impulsenoise$ is given by

$$p(z) = \begin{cases} P_a, & for\ z = a \\ P_b, & for\ z = b \\ 0, & otherwise \end{cases} \tag{4.20}$$

Figure 4.6: Impulse Noise

4.3 Mean Filters

4.3.1 Filters

Arithmetic mean filter

$$\hat{f}(x,y) = \frac{1}{mn} \sum_{(s,t)\in S_{xy}} g(s,t) \tag{4.21}$$

Geometric mean filter

$$\hat{f}(x,y) = [\prod_{(s,t)\in S_{xy}} g(s,t)]^{\frac{1}{mn}} \tag{4.22}$$

Harmonic mean filter

$$\hat{f}(x,y) = \frac{mn}{\sum_{(s,t)\in S_{xy}} \frac{1}{g(s,t)}} \tag{4.23}$$

Contraharmonic mean filter

$$\hat{f}(x,y) = \frac{\sum_{(s,t)\in S_{xy}} g(s,t)^{Q+1}}{\sum_{(s,t)\in S_{xy}} g(s,t)^{Q}} \tag{4.24}$$

4.3.2 Results

Figure 4.7: Original Book FIGURE 5.7

Figure 4.8: Original Book FIGURE 5.8

Figure 4.9: Original Book FIGURE 5.9

4.4 Order-Statistic Filters

4.4.1 Filters

Median filter

$$\hat{f}(x,y) = median_{(s,t)\in S_{xy}} g(s,t) \tag{4.25}$$

Max filters

$$\hat{f}(x,y) = max_{(s,t)\in S_{xy}} g(s,t) \tag{4.26}$$

Min filters

$$\hat{f}(x,y) = min_{(s,t)\in S_{xy}} g(s,t) \tag{4.27}$$

Midpoint filter

$$\hat{f}(x,y) = \frac{1}{2}[max_{(s,t)\in S_{xy}} g(s,t) + min_{(s,t)\in S_{xy}} g(s,t)] \tag{4.28}$$

Alpha-trimmed mean filter

$$\hat{f}(x,y) = \frac{1}{mn-d} \sum_{(s,t)\in S_{xy}} g_r(s,t) \tag{4.29}$$

4.4.2 Results

Figure 4.10: Original Book FIGURE 5.10

Figure 4.11: Original Book FIGURE 5.11

Figure 4.12: Original Book FIGURE 5.12

5.1 OverView

Suppose a blurring degradation function as

$$H(u,v) = \frac{T}{\pi(ua+vb)} sin(\pi(ua+vb))e^{-j\pi(ua+vb)} \tag{5.1}$$

1. Implement a blurring filter using Eq. (5.1).
2. Blur the test image book_cover.jpg using parameters $a = b = 0.1$ and $T = 1$.
3. Add Gaussian noise of 0 mean and variance of 650 to the blurred image.
4. Restore the blurred image and the blurred noisy image using the inverse filter, Wiener filter, respectively.
5. Add Gaussian noise of 0 and different variances to the blurred image and repeat 4, investigate the performance of the Wiener filter.

5.2 Fliter

5.2.1 Motion Filter

Assume that we know $x_0(t)$, $y_0(t)$, and the image is moving in x-axis and y-axis moving according to the $x_0(t) = \frac{at}{T}$, $y_0(t) = \frac{bt}{T}$. Then we know:

$$H(u,v) = \frac{T}{\pi(ua+vb)} sin(\pi(ua+vb))e^{-j\pi(ua+vb)} \tag{5.2}$$

5.2.2 Inverse Filter

$$\hat{F}(u,v) = \frac{G(u,v)}{H(u,v)} \tag{5.3}$$

With noise:

$$\hat{F}(u,v) = F(u,v) + \frac{N(u,v)}{H(u,v)} \tag{5.4}$$

5.2.3 Wiener Filter

$$\hat{F}(u,v) = [\frac{1}{H(u,v)} \frac{|H(u,v)|^2}{|H(u,v)|^2 + K}]G(u,v) \tag{5.5}$$

5.3 Results

We can easily find that the performance of wiener filter is much better than inverse filter, and less the variance of the noise is, better the performance of the winner is.

Figure 6.4: Original Image

Figure 6.5: Translate X:500 and Y:500

Figure 6.6: Translate X:-500 and Y:-500

6.2.5 Scaling

(v, w) are pixel coordinates in the original image and (x, y) are the corresponding pixel coordinates in the transformed image

$$\begin{bmatrix} x & y & 1 \end{bmatrix} = \begin{bmatrix} v & w & 1 \end{bmatrix} T = \begin{bmatrix} v & w & 1 \end{bmatrix} \begin{bmatrix} c_x & 0 & 0 \\ 0 & c_y & 0 \\ 0 & 0 & 1 \end{bmatrix} \tag{6.3}$$

6.2.6 Results

Since the original image is too large to show the detial change, I scale the original image to 0.25*0.25(b) and then scale (b) to 2*2.

(a) Original Image

Figure 6.7: Original Image

(b) Scale (a) to 0.25*0.25

Figure 6.8: Scaling 0.25*0.25 without interpolation

Scale (b) to 2*2

Figure 6.9: Scaling 2*2 without interpolation

6.3 Interpolation Methods

6.3.1 Methods

Nearest Neighbor Interpolation

We look for its closest pixel in the original image and assign the intensity of that pixel to the new pixel.

Bilinear Interpolation

We use the four nearest neighbors to estimate the intensity at a given location.

6.3.2 Results

Rotate (a) by pi/6 using nearest neighbor

7.1 OverView

Implement the "Opening by reconstruction", "Filling holes" and "Border clearing" operations on pages 681-683 (pp.659-661 for the electronic textbook), and reproduce the results in Figure 9.29, Figures 9.31, and Figure 9.32.

7.2 Erosion and Dilation

7.2.1 Erosion

With A and B as sets in Z^2 , the erosion of A by B, denoted $A \ominus B$, is defined as

$$A \ominus B = \{z|(B)_z \subseteq A\} \tag{7.1}$$

or

$$A \ominus B = \{z|(B)_z \cap A^c = \varnothing\} \tag{7.2}$$

ponents or broken connection paths. There is no poi
tion past the level of detail required to identify those
Segmentation of nontrivial images is one of the mos
processing. Segmentation accuracy determines the ev
of computerized analysis procedures. For this reason,
be taken to improve the probability of rugged segment
such as industrial inspection applications, at least some
the environment is possible at times. The experienced
designer invariably pays considerable attention to suc

Figure 7.1: Original Image

Figure 7.2: Erosion of Figure 7.1

7.2.2 Dilation

With A and B as sets in Z^2 , the erosion of A by B, denoted $A \oplus B$, is defined as

$$A \ominus B = \{z|(\hat{B})_z \cap A \neq \varnothing\} \tag{7.3}$$

or

$$A \ominus B = \{z|[(\hat{B})_z \cap A] \subseteq A\} \tag{7.4}$$

Figure 7.3: Erosion of Figure 7.2

7.3 Geodesic dilation and erosion

7.3.1 Geodesic dilation

Let F denote the marker image and G the mask image. It is assumed in this discussion that both are binary images and that $F \subseteq G$. The *geodesic dilation* of size 1 of the marker image with respect to the mask, denoted by $D_G^{(1)}(F)$, is defined as

$$D_G^{(1)}(F) = (F \oplus B) \cap G \tag{7.5}$$

The *geodesic dilation* of size n of F with respect to G is defined as

$$D_G^{(n)}(F) = D_G^{(1)}[D_G^{(n-1)}(F)] \tag{7.6}$$

7.3.2 Geodesic erosion

Similarly, the *geodesic erosion* of size 1 of marker F with respect to mask G is defined as

$$E_G^{(1)}(F) = (F \ominus B) \cup G \tag{7.7}$$

The *geodesic erosion* of size n of F with respect to G is defined as

$$E_G^{(n)}(F) = E_G^{(1)}[E_G^{(n-1)}(F)] \tag{7.8}$$

7.4 Opening by reconstruction

Opening by reconstruction restores *exactly* the shapes of the objects that remain after erosion.The opening by reconstruction of size n of an image F is defined as the reconstruction by dilation of F from the erosion of size n of F; that is,

$$O_R^{(n)}(F) = R_F^D[(F \ominus nB)] \tag{7.9}$$

Figure 7.4: Opening by reconstruction of Figure 7.3

7.5 Filling holes

Let $I(x, y)$ denote a binary image and suppose that we form a marker image F that is 0 everywhere, except at the image border, where it is set to 1 - I; that is,

$$F(x,y) = \begin{cases} 1 - I(x,y), & if\ (x,y)\ is\ on\ the\ border\ of\ I \\ 0, & otherwise \end{cases} \tag{7.10}$$

Then

$$H = [R_{I^c}^D(F)]^c \tag{7.11}$$

is a binary image equal to I with all holes filled.

Figure 7.5: Filling holes of Figure 7.1

7.6 Border clearing

We use the original image as the mask and the following marker image:

$$F(x,y) = \begin{cases} I(x,y), & if\ (x,y)\ is\ on\ the\ border\ of\ I \\ 0, & otherwise \end{cases} \tag{7.12}$$

The border-Eclearing algorithm first computes the morphological reconstruction $R_I^D(F)$ (which simply extracts the objects touching the border) and then computes the difference

$$X = I - R_I^D(F) \tag{7.13}$$

to obtain an image, X, with no objects touching the border.

Figure 7.6: Border clearing of Figure 7.1

8.1 OverView

(a). Develop a program to implement the Roberts, Prewitt, Sobel, the Marr-Hildreth and the Canny edge detectors. Use the image 'building.tif' to test your detectors. (For technique details of Marr-Hildreth and Canny, please refer to pp.736-747 (3 rd edition, Gonzalez DIP, or pp.705-725 for the electronic textbook) or MH-Canny.pdf at the same address of the slides.)
(b). Develop a program to implement the Otsu' s method of thresholding segmentation, and compare the results with the global thresholding method using test image 'polymersomes.tif. (For technique details, please refer to pp.763-770 (3 rd edition, Gonzalez DIP, or pp.742-747 for the electronic textbook, or Otsu.pdf at the same ftp address of slides.)

8.2 Edge Detectors

8.2.1 Roberts

The Roberts operators are based on implementing the diagonal differences

$$g_x = \frac{\partial f}{\partial x} = z_9 - z_5 \tag{8.1}$$

$$g_y = \frac{\partial f}{\partial y} = z_8 - z_6 \tag{8.2}$$

Figure 8.1: Test Image

Figure 8.2: Roberts gx of Figure8.1

Figure 8.3: Roberts gy of Figure8.1

Figure 8.4: Roberts result of Figure8.1

8.2.2 Prewitt

The Prewitt operators:

$$g_x = \frac{\partial f}{\partial x} = (z_7 + z_8 + z_9) - (z_1 + z_2 + z_3) \tag{8.3}$$

$$g_y = \frac{\partial f}{\partial y} = (z_3 + z_6 + z_9) - (z_1 + z_4 + z_7) \tag{8.4}$$

Figure 8.5: Prewitt gx of Figure8.1

Figure 8.6: Prewitt gy of Figure8.1

Figure 8.7: Prewitt result of Figure8.1

8.2.3 Sobel

The Sobel operators:

$$g_x = \frac{\partial f}{\partial x} = (z_7 + 2z_8 + z_9) - (z_1 + 2z_2 + z_3) \tag{8.5}$$

$$g_y = \frac{\partial f}{\partial y} = (z_3 + 2z_6 + z_9) - (z_1 + 2z_4 + z_7) \tag{8.6}$$

Figure 8.8: Sobel gx of Figure8.1

Figure 8.9: Sobel gy of Figure8.1

Figure 8.10: Sobel result of Figure8.1

8.2.4 Marr-Hildreth

- Calculate the Laplacian of Gaussian

$$LoG(x,y) = [\frac{x^2+y^2-2\sigma^2}{\sigma^4}]e^{-\frac{x^2+y^2}{2\sigma^2}} \tag{8.7}$$

- Find the zero crossings of the image from last step
  - One approach for finding the zero crossings at any pixel, p, of the filtered image, $g(x,y)$, is based on using a 3 * 3 neighborhood centered at p. A zero crossing at p implies that the $signs$ of at least two of its opposing neighboring pixels must differ.There are four cases to test: left/right, up/down, and the two diagonals. If the values of $g(x,y)$ are being compared against a threshold (a common approach), then not only must the signs of opposing neighbors be different, but the absolute value of their numerical difference must also exceed the threshold before we can call p a zero-crossing pixel.

Figure 8.11: Marr-Hildreth result of Figure8.1

8.2.5 Canny

Let $f(x,y)$ denote the input image and $G(x,y)$ denote the Gaussian function:

$$G(x,y) = e^{-\frac{x^2+y^2}{2\sigma^2}} \tag{8.8}$$

We form a smoothed image, $f_s(x,y)$, by convolving G and f:

$$f_s(x,y) = G(x,y) \bigstar f(x,y) \tag{8.9}$$

This operation is followed by computing the gradient magnitude and direction (angle)

$$M(x,y) = \sqrt{g_x^2 + g_y^2} \tag{8.10}$$

$$\alpha(x,y) = tan^{-1}[\frac{g_y}{g_x}] \tag{8.11}$$

with $g_x = \frac{\partial f_s}{\partial x}$ and $g_y = \frac{\partial f_s}{\partial y}$.

- Find the direction d_k that is closest to $a(x,y)$
- If the value of $M(x,y)$ is less than at least one of its two neighbors along d_k , let $g_N(x,y) = 0(suppression)$; otherwise, let $g_N(x,y) = M(x,y)$.
- Use double thresholding and connectivity analysis to detect and link edges.

Figure 8.12: Canny result of Figure8.1

8.3 Thresholding Segmentation

8.3.1 Global Thresholding

the segmented image, $g(x, y)$, is given by

$$g(x,y) = \begin{cases} 1, & if\ f(x,y) > T \\ 0, & if\ f(x,y) \leq T \end{cases} \tag{8.12}$$

- Select an initial estimate for the global threshold, T.
- Segment the image using T in Eq. (8.12).This will produce two groups of pixels: G_1 consisting of all pixels with intensity values $> T$, and G_2 consisting of pixels with values $\leq T$.
- Compute the average (mean) intensity values m_1 and m_2 for the pixels in G_1 and G_2 , respectively.
- Compute a new threshold value: $T = \frac{m_1+m_2}{2}$
- Repeat Steps 2 through 4 until the difference between values of T in successive iterations is smaller than a predefined parameter $\triangle T$

Figure 8.13: Test Image

Figure 8.14: Global Thresholding of Figure 8.13

8.3.2 Otsu

the probability, $P_1(k)$, that a pixel is assigned to (i.e., thresholded into) class C_1 is given by the cumulative sum

$$P_1(k) = \sum_{i=0}^{k} p_i \tag{8.13}$$

The cumulative mean (average intensity) up to level k is given by

$$m(k) = \sum_{i=0}^{k} ip_i \tag{8.14}$$

the average intensity of the entire image (i.e., the $global$ mean) is given by

$$m_G = \sum_{i=0}^{L-1} ip_i \tag{8.15}$$

we have the final results:

$$\sigma_B^2(k) = \frac{[m_G P_1(k) - m(k)]^2}{P_1(k)[1 - P_1(k)]} \tag{8.16}$$

Otsu' s algorithm may be summarized as follows:

- Compute the normalized histogram of the input image. Denote the components of the histogram by $p_i, i = 0, 1, 2, \cdots, L-1$.
- Compute the cumulative sums, $P_1(k)$, for $k = 0, 1, 2, \cdots, L-1$, using Eq. (8.13).
- Compute the cumulative means, $m(k)$, for $k = 0, 1, 2, \cdots, L-1$, using Eq. (8.14).
- Compute the global intensity mean, m_G , using (8.15).
- Compute the between-class variance, $\sigma_B^2(k)$, for $k = 0, 1, 2, \cdots, L-1$, using Eq. (8.16).
- Obtain the Otsu threshold, k^*, as the value of k for which $\sigma_B^2(k)$ is maxi-mum. If the maximum is not unique, obtain k^* by averaging the values of k corresponding to the various maxima detected.
